

Narrow Pontoon Lift

The best way to lift a pontoon

HEWITT

Hewitt's Narrow Pontoon Lifts safely and easily raise and lower even the longest pontoon boats. Full-length beams are positioned between the pontoons, not beneath them. This design evenly distributes weight to the boat's deck, eliminating any risk of damage to the pontoons.

Narrow Pontoon Lifts are available in three standard sizes: 2000 lb - 20' length, 2400 lb - 24' length, 3000 lb - 28' length and 4000 lb - 28' length. These lifts are built to the same high standards of durability that are a trademark of all Hewitt Lifts.

Features

- Heavy-duty all-aluminum construction – corrosion resistant, low maintenance.
- Acetal delrin plastic pulleys and stainless steel cable. Pulleys and cable remain completely out of the water in the lift's "up" position. When the lift is fully raised, there is also no stress on the cables - the load is entirely on the frame which further extends cable life.
- Standard manual self-braking winch with 40" wheel and spinner knob included on Model 2000.
- Hewitt high-efficiency winch with 40" wheel and spinner knob included on Models 2400, 3000 and 4000.
- Fully-enclosed chain drive provides a 15:1 or 20:1 gear ratio.

Optional Off-Set Winch Arm

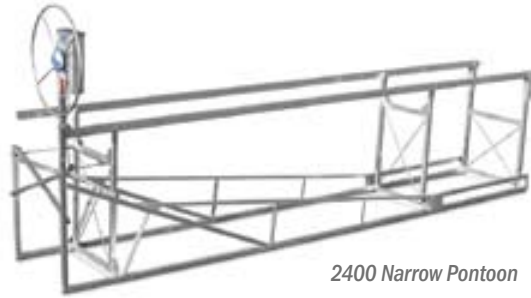

Offers additional flexibility and convenience for existing dock configurations. Allows the winch to be operated from the side rather than from the front.

See pages 36-47 for complete information on options, accessories and canopies.
